NYAYSETU

Evidence Integrity Passport

Public edition — no personal or case data.

Scan to verify online

VERIFIED ON CHAIN

Confirmed on the blockchain

The fingerprint is recorded on the blockchain and has been checked against the transaction. A file that produces the same fingerprint is unchanged since it was registered. This does not prove what the file shows is true, or how it was collected.

Verify it yourself

1. Open https://nyaysetu-project.vercel.app/verify/NSE-M50DF6WYJVJRF1F5H0AMWZVR9W (or scan the QR code) and drop the photograph or recording into the check box. It is hashed in your browser; the file is not uploaded.
2. For a live capture the blockchain holds the digest of the capture manifest, which contains the file's digest. The check substitutes your file's digest into the recorded manifest and compares the result with the blockchain.
3. Independently: look up the transaction on a block explorer and compare the fileHash in the EvidenceRegistered event with the digest above.

LIMITS OF WHAT THIS PROVES

A matching fingerprint (SHA-256) proves that a file is bit-for-bit identical to the one whose fingerprint was recorded on the blockchain at registration. It does not prove that what the file shows is true, that it was lawfully collected, that a scene was genuine or not staged, that a location reading was not spoofed, or who is responsible for anything it depicts. Those are questions for investigation and for the court.
