Problem statement

Title: Proof, not paperwork — verifiable evidence, summons and bail records for Maharashtra's criminal courts

Domain: Governance and civic technology (primary); emerging technology — blockchain, AI and GIS; digital inclusion **State:** Maharashtra **UN SDG:** 16 — Peace, justice and strong institutions (16.3, 16.6, 16.10)

The problem

In Maharashtra's criminal courts, three questions are routinely answered by the word of an interested party rather than by a record anyone can check.

1. **Is this the evidence that was collected?** Digital evidence — photographs, CCTV, phone extractions, search-and-seizure video — passes from police to malkhana, forensic laboratory, prosecutor and court. Custody is recorded in registers that say an item moved, not that the item which arrived is the item which left. The defence must accept the prosecution's own copy and log.
2. **Did the summons reach the person it named?** Service is disputed, and hearings are adjourned while it is attempted again.
3. **Are bail conditions being kept?** Conditions are written into an order that nobody monitors until something has already gone wrong.

Why now, and why Maharashtra

- **New legal duties since 1 July 2024.** BNSS §105 requires audio-video recording of searches and seizures; BNSS §176(3) requires forensic collection and recording at the scene of serious offences; BSA §63 requires a certificate stating the hash value of every electronic record produced in court. Officers now produce far more digital evidence, each item needing a chain of custody a court can rely on.
- **Pendency.** Maharashtra's district courts carry more than fifty lakh pending cases, most of them criminal (National Judicial Data Grid). Custody disputes and failed service add adjournments to an already long queue.
- **Forensic load.** Forensic laboratories report substantial backlogs, and the new scene-collection duty adds to the material they receive.

Who is affected

Investigating officers and malkhana staff; forensic laboratories; public prosecutors; judges and court registries; defence counsel and legal-aid lawyers; and accused persons and witnesses — often first-generation litigants who read neither legal English nor the documents served on them.

What is missing today

Existing systems record media (e-Sakshya), exchange case data (CCTNS, ICJS) and publish case status (e-Courts, NJDG). None lets a party who does not trust the prosecution verify, independently and without permission, that an exhibit is unchanged since capture; none ties evidence custody, service of summons and bail compliance into one verifiable record; and none explains a person's obligations to them in their own language.

Proposed solution in one paragraph

NyaySetu fingerprints each piece of evidence (SHA-256) on the officer's phone at the moment of capture, before upload, and anchors the fingerprint on a public blockchain. Every hand-over re-checks it; a mismatch is refused and recorded permanently. Anyone — including the accused — can verify a file against the ledger from a public page without an account. Summons acknowledgement and bail check-ins are recorded the same way, the BSA §63 certificate is generated from the record with a QR code back to verification, and obligations are explained in Marathi, Hindi or English and read aloud. Personal data never goes on the ledger.

Expected outcomes

- Fewer chain-of-custody disputes and adjournments; faster §63 compliance.
- Independent verification for the defence and the accused (access to justice).
- Earlier detection of bail breaches, and a way for compliant accused to show compliance.
- Public confidence through a transparency page with live, non-identifying figures.
